AIR PURIFIERS

What's in the air?

It's a fact: Indoor air is up to five times more polluted than outdoor air—and outdoor air is plenty polluted. Enclosed spaces in buildings are rife with allergens, contaminants, volatile organic compounds (VOCs) and viruses—like COVID-19.

That's why it's important to replace your Fellowes® AeraMax® Pro filters regularly. The True HEPA filtration with antimicrobial treatments remove 99.97 percent of airborne particles at 0.3 microns from enclosed spaces including allergen such as pollen, dust, pet dander, and smoke.

Fellowes suggests replacing the complete filter sets once a year; monitor each unit's filter change indicator to determine when to change filters. And, if the enclosed area has been vacant during the pandemic but is accepting people again, you'll want a fresh set of filters for the units.

Don't let the danger in the air linger.
